Spot In The Dark Osu Journal Award Poetry

Black rot and frog-eye leaf spot are phases of a widespread and damaging disease of apple and crabapple. The fruit rot phase is called black rot and on the leaf it is called frog-eye leaf spot. The disease can result in losses from a rotting of fruit before harvest and in storage, a weakening of the tree from defoliation, and a blighting and dieback of twigs and limbs caused by girdling cankers.

Black Rot and Frog-eye Leaf Spot of Apple | Ohioline

Symptoms of black rot first appear as small yellow spots on leaves. Enlarged spots (lesions) have a dark brownish-red border with tan to dark brown centers (Figure 1). As the infection develops, tiny black dots appear in the lesion, usually in a ring pattern near the border of the lesion (Figure 1-inset).

Grape Black Rot | Ohioline

In fall, look for yellow to tan spots that enlarge to form brown to reddish-brown spots and bands that girdle needles. Look for dead tips beyond the band, while the base of the needle remains green. Use a hand lens to observe small black fruiting bodies in dead spots and bands on needles in the spring. Cultural control practices:

What is it? What to do about it? | Ornamental Disease Facts

Eventually, tiny black dots called spermogonia appear in the spots on the upper leaf surface and short tube-like structures called aecia extend from the spots on the lower leaf surface. Spores from the aecia, called aeciospores, drift on the wind to infect Juniperus hosts in late summer and autumn to start the alternating-host life cycle over again.
